**Echo Barrier**

Echo Barrier's patented acoustic technology is the key to cost-effective noise management across a multitude of construction projects. ASTM E84 tests for flame spread and smoke development indicate its suitability for projects subject to highly stringent fire regulations. Echo Barriers are resistant to both water and extremes of temperature, and are safe to handle as they contain no fiberglass or hazardous materials. Echo Barriers are readily fitted onto standard fencing, perimeter fencing, plywood fencing, metal panels, scaffolding or any existing structure that can bear the increased load. Echo Barrier's innovative acoustic barriers are designed for easy transportation and for quick installation and disassembly. Compact, durable and light in weight - as little as 11.7 lbs and they are flexible and self-lock when rolled up.
